Complementary Applications

Remote Client Files

SMS Remote Client Files is a server based application that can be accessed (via remote desktop) by users in the field using an internet connection. Once a user is logged into Client Files they can see a Browse of the clients they are rostered to see that day or previous and forward days. With a client selected the user can complete various tasks for a clients file as required including updating details, adding notes as well as viewing and uploading files for the client's record.

Mobile Worker

Mobile Worker Web Interface is the perfect add on module for Service Management System (SMS) Community Care Software. Developed to meet a vital need in community care worker management, this module allows seamless connection and communication between head office (Program Managers and SMS) and off site care workers.

With no special hardware or app required, the SMS Mobile Worker Web Interface allows care workers to use any available internet connection to provide and receive rosters, timesheets and messages. Saving both time and money, (compared with the cost to your organisation for text messaging, faxing, devices, data plans etc.

Workers can view rostered services with their attached plans as well as log start and finish times in real time. When logging times for services GPS can be used to ensure worker is within radius of clients location before sign in/out. Options to apply for leave as well as download documents are also available.
